Introduction

Often you **pay for information** you are asking for:

- Investment Advice
- Management Consultants
- Market Investigation
- Palm Reading

You need this information to make a decision in the future:

- To invest in a particular stock or not
- To restructure the organization of your company or not
- To introduce a product or not
- Should I marry this person or not

Introduction

Problem at hand:

Given your decision problem, how much should you be willing to pay for this information?

• To answer this questions you have to determine the value (in dollars) of information.

• We will first discuss a method for determining the value of **perfect information** and next for **imperfect information**.

WHICH ONE DO YOU VALUE MORE?

R. T. Clemen, T. Reilly

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/

Definition: Clairvoyant Expert on event A

If event A is about to occur, the expert says, it will. If event A is not to occur, the expert says, it will not. The expert is **NEVER** wrong. His information is **PERFECT**.

A = { Dow Jones index goes up} "A" = {**Expert Says** Dow Jones index goes up}

You are considering investing in a company, but before you do you want to make sure that the **Dow Jones index will go up** as this increases your chances of making a good investment. Therefore, you decide to consult a clairvoyant expert on the event A.

Probability and Perfect Information

What does it mean to be clairvoyant in probabilistic terms?

Pr({ Expert Says Dow Jones ↑ } | { Dow Jones ↑ }) = Pr("A" | A) = 1

Similarly:

$$\Pr("A" | A) = 1 \Leftrightarrow 1 - \Pr(\overline{"A"} | A) = 1 \Leftrightarrow \Pr(\overline{"A"} | A) = 0$$
$$\Pr("A" | \overline{A}) = 0 \Leftrightarrow 1 - \Pr(\overline{"A"} | \overline{A}) = 0 \Leftrightarrow \Pr(\overline{"A"} | \overline{A}) = 1$$

Perhaps more importantly, what about?

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/

Slide 5 of 29 COPYRIGHT © 2006 by GWU

Probability and Perfect Information

$$\Pr(A \mid "A") = \frac{\Pr("A" \mid A) \Pr(A)}{\Pr("A")} =$$
$$\frac{\Pr("A" \mid A) \Pr(A)}{\Pr("A" \mid A) \Pr(A) + \Pr("A" \mid \overline{A}) \Pr(\overline{A})} =$$
$$\frac{1 \cdot \Pr(A)}{1 \cdot \Pr(A) + 0 \cdot \Pr(\overline{A})} = 1$$

Conclusion:

Pr(A|"A") equals 1 no matter what the value of Pr(A) is.

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/ Slide 6 of 29 COPYRIGHT © 2006 by GWU What about the probability $Pr(\{ Expert Says Dow Jones \uparrow \})?$

$$Pr("A") = Pr(\{ Expert Says Dow Jones \uparrow \}) =$$

 $\Pr("A"|A)\Pr(A) + \Pr("A"|\overline{A})\Pr(\overline{A}) =$

 $1 \cdot \Pr(A) + 0 \cdot \Pr(\overline{A}) = \Pr(A) = \Pr(\{\text{Dow Jones} \uparrow\})$

This is true in general: if we consult a clairvoyant expert about an event a with possible outcomes $\{A_1, \dots, A_n\}$ then:

$$Pr("A_i") = Pr(A_i)$$
, for all $i = 1, \dots, n$

Draft: Version 1

After consulting the clairvoyant expert about event a, no uncertainty remains about event a.

Making Hard Decisions R. T. Clemen, T. Reilly Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/

STOCK MARKET EXAMPLE:

R. T. Clemen, T. Reilly

Chapter 12 – Value of Information

Slide 8 of 29 COPYRIGHT © 2006 by GWU

Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/

Consider first talking to a clairvoyant expert and then making the investment decision:

Of course, the **clairvoyant expert** will charge a fee and you would like to know how much you would be willing to pay before using his services.

Conclusion:

You would be willing to consult the clairvoyant expert if:

1000 - X ≥ 580 \iff X ≤ 1000 - 580 = 420 (=EVPI)

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/ Slide 10 of 29 COPYRIGHT © 2006 by GWU EVPI = Expected Value of Perfect Information

Interpretation:

EVPI is the **maximum amount of money** you would be willing to pay for the services of the **clairvoyant expert**. If he charges more than \$420 you would not consult the expert.

A = { Dow Jones index goes up} "A" = {Expert Says Dow Jones index goes up}

Consider an Expert about event A, who is **not clairvoyant**, but is considered to be an expert. What does it mean in for an expert **not to be perfect** in his assessment about event A?

Pr({Expert Says Dow Jones 1} | {Dow Jones 1}) =
Pr("A" | A) < 1

Hopefully, the probability above is close to 1 (otherwise why consider him/her and Expert?)

• Pr({Expert Says Dow Jones \uparrow } | {Dow Jones \downarrow }) = Pr("A" | \overline{A}) > 0

Hopefully, the probability above is close to 0 (otherwise why consider him/her and Expert?)

Draft: Version 1

When an expert about an event is **not clairvoyant** you need to express **your trust** in his assessment by for example, checking his past performances and interviewing references.

Based on **your background-check** of the expert you assess your trust in terms of subjective probabilities.

	True Market State				
Expert Prediction	UP	FLAT	DOWN

Chapter 12 – Value of Information

Slide 19 of 29 COPYRIGHT © 2006 by GWU

Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/

Note That:

After consulting the expert the uncertainty remains

 After consulting an imperfect expert, the original decision problem still remains. The only difference is that probabilities of the original decision problem have changed to reflect the additional information, i.e the expert's advise.

Draft: Version 1

To calculate the EMV of the decision problem **after consulting the imperfect expert** we have to solve for the probabilities in the decision tree above. Calculating these probabilities is equivalent with **FLIPPING** the order of the uncertainty nodes.

How can we solve for these probabilities? Via **Bayes theorem** using a **probability table**

Making Hard Decisions R. T. Clemen, T. Reilly Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi

STEP 2: Insert the probabilities in the probability tree

R. T. Clemen, T. Reilly

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi

http://www.seas.gwu.edu/~dorpjr/

Slide 23 of 29 COPYRIGHT © 2006 by GWU

STEP 3: Calculate EMV after consulting the expert

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi

http://www.seas.gwu.edu/~dorpjr/

Slide 24 of 29 COPYRIGHT © 2006 by GWU

STEP 3B: Calculate EMV after consulting the expert

Chapter 12 – Value of Information

Slide 25 of 29 COPYRIGHT © 2006 by GWU

Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpjr/

STEP 3C: Calculate EMV after consulting the expert

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi

http://www.seas.gwu.edu/~dorpjr/

Slide 26 of 29 COPYRIGHT © 2006 by GWU

STEP 3D: Calculate EMV after consulting the expert

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpir/

Slide 27 of 29 COPYRIGHT © 2006 by GWU

STEP 4: Calculate EVII for consulting the expert

MAX. PROFIT

Conclusion:

You would be willing to consult the clairvoyant expert if:

822 - X
$$\geq$$
 580 \Leftrightarrow X \leq 822 - 580 = 242 (=EVII)

EVII = Expected Value of Imperfect Information

Making Hard Decisions R. T. Clemen, T. Reilly

Chapter 12 – Value of Information Lecture Notes by: J.R. van Dorp and T.A. Mazzuchi http://www.seas.gwu.edu/~dorpir/ Slide 28 of 29 COPYRIGHT © 2006 by GWU

Interpretation:

EVII is the maximum amount of money you would be willing to pay for the services of the **imperfect expert**. If he charges more than \$242 you would not consult the expert.

Note:

 EVPI ≥ EVII. Interpretation: Perfect Information is always better than imperfect information.

 When performing sensitivity analysis EVPI calculation of every uncertain event should be considered. When EVPI is high for a particular uncertain event, investment to reduce uncertainty may be warranted.
