The Poliovirus Problem

Science magazine

VOL 297, 9 August 2002

Cello, J; Paul, A.V. & Wimmer, E.:

Chemical Synthesis of Poliovirus cDNA: Generation of Infectious Virus in the Absence of Natural Template

- they generated about 7.7 kilobases of single-stranded RNA genome based on the know genetic map
- DNA fragments were synthesized from purified oligo-nucleotides (average length 69: bases)
- the cDNA was then transcribed into highly infectious RNA

The Poliovirus Problem

washingtonpost.com

17 July 2002

Weiss, R.:

Mail-Order Molecules Brew a Terrorism Debate

- mail-order oligonucleotides can be used to manufacture a deadly virus
- because they are so small, most oligos lack a “fingerprint”
- call for more control and/or institutional oversight
- method could be used to manufacture other deadly viruses

What is Bioinformatics?

Bioinformatics.org

The scientific field of bioinformatics involves the use of information systems to analyze large biological data sets, often DNA and protein sequences. A subdiscipline of computational biology, it is relatively new, having been derived from individual efforts in the statistical analysis of sequences. The first reference to the word "bioinformatics" in the scientific literature was in 1991.

What is Bioinformatics?

<http://www.netsci.org/Science/Bioinform>

The first level ... can be defined as the design and application of methods for the collection, organization, indexing, storage, and analysis of biological sequences (both nucleic acids [DNA and RNA] and proteins). The next stage of bioinformatics is the derivation of knowledge concerning the pathways, functions, and interactions of these genes (functional genomics) and proteins (proteomics).

Course objective

The general objective of the course is to provide a one semester introduction and overview to the fields of bioinformatics

The aim is to provide a practical description of the topics, tools, issues and current trends in the fields

As an introductory course, the focus will not be on the theoretical and computational aspects of the fields.

Students should become familiar with the terminology, principles, and strategies in bioinformatics

They will learn to use conventional software and web-based applications

Students should gain competence in the field of bioinformatics by using the approach of problem-based learning

Course schedule

Lecture 2 (Jan 27): Cell Biology Overview

- * Organisms, organs, tissues, cells.
- * Cell components.
- * Eukaryotic vs. prokaryotic cells.
- * Overview of diseases, immune system.
- * Biomolecules, proteins

Lecture 3 (Feb 2): DNA/RNA overview

- * DNA and its components
- * RNA and its components
- * PCR, sequencing
- * Mutations

Lecture 4 (Feb 9): Nucleotide and protein databases

- * Public sequence databases
- * Sequence retrieval and examples
- * Similarity searching
- * Gene identification
- * Genetic and physical map
- * Protein databases
- * Data exchange and management

Lecture 5 (Feb 16): Hands-on lab with databases

- * Motivating problem: the poliovirus
- * Review nucleotide and protein databases
- * Sequence formats
- * Lab exercises in using GenBank

Examples

Course outline

Course schedule (continued)

Lecture 6 (Feb 23): The Alignment problem

Part I:

- * Pairwise alignment
- * Dynamic programming algorithm

Part II:

- * Multiple alignment
- * Editing and formatting alignments

Lecture 7 (Mar 3): The new biology lab

- * Old technology overview: microscopy ...
- * PCR, sequencing,
- * Microarrays
- * Crystallography
- * Mass-spec

Lecture 8 (Mar 10): Proteins, part 1 (Structure-function relationships)

- * Review of protein structures
- * Experimental techniques to determine protein structures
- * Protein databases

Lecture 9 (Mar 24): Proteins, part 2 (Computational modeling)

- * Database similarity search
- * Protein family analysis
- * Structural analysis
- * Three-dimensional comparative modeling
- * Three-dimensional structural analysis in laboratory

Course schedule (continued)

Lecture 10 (Mar 31): Phylogenetics I

- * Evolution: overview
- * Taxonomy and phylogenetics
- * Phylogenetic trees
- * Cladistic vs. phenetic analyses
- * Models of sequence evolution

Lecture 11 (Apr 7): Phylogenetics II

- * Phylogenetic trees and networks
- * Cladistic and phenetic methods
- * Computer software and demos

Lecture 12 (Apr 14): Field trip

Lecture 13 (Apr 21): Student presentations

Lecture 14 (Apr 29): Simulations (time permitting)

- * Simulations
- * Biological metaphors in computing

Final Examination (May 5)

What is expected from students?

- Students should anticipate spending a minimum of ~ 3 hrs a week outside of class reading and studying the lecture notes and reading assignments and carrying out the assigned homework/exercises
- Students will need access to a computer with an internet connection and e-mail
- PC access is available on campus at Tomkins 405 and Himmelfarb library
- E-mail is necessary for submission of homework

- [Systems down today for software upgrades](#)

J.W. Bizzaro - 01/04/02 14:18 (1 comment)

The systems may be down for a couple hours today (January 4) for some software upgrades, starting around 22:00 GMT. Please do not use the systems for any important work at that time.

- [FTP temporarily down due to system upgrade](#)

J.W. Bizzaro - 11/09/01 17:21

FTP will be unavailable for an hour or so after receipt of this notice. We are expanding the hard drive capacity of the projects server (currently dubbed "depot") by about 62 GB. The new space will eventually be used for project shell, Web and CVS space, in addition to FTP and backups.

- [File release function being worked on -- temporarily off line](#)

J.W. Bizzaro - 10/13/01 02:10

For project administrators, the file release function is being worked on this weekend. Some improvements are planned, such as placing the files on FTP rather than on the Web. Please do not use this feature until further notice. If you need to make a file available, please use your FTP directory.

BIOINFORMATICS

Introduction

- [Databases](#)
- [Finding Genes](#)
- [Protein Models](#)

In the last few decades, advances in molecular biology and the equipment available for research in this field have allowed the increasingly rapid sequencing of large portions of the genomes of several species. In fact, to date, several bacterial genomes, as well as those of some simple eukaryotes (e.g., *Saccharomyces cerevisiae*, or baker's yeast) have been sequenced in full. The Human Genome Project, designed to sequence all 24 of the human chromosomes, is also progressing. Popular sequence databases, such as GenBank and EMBL, have been growing at exponential rates. This deluge of information has necessitated the careful storage, organization and indexing of sequence information. Information science has been applied to biology to produce the field called **Bioinformatics**.

The simplest tasks used in bioinformatics concern the creation and maintenance of databases of biological information. Nucleic acid sequences (and the protein sequences derived from them) comprise the majority of such databases. While the storage and organization of millions of nucleotides is far from trivial, designing a database and developing an interface whereby researchers can both access existing information and submit new entries is only the beginning.

The most pressing tasks in bioinformatics involve the analysis of sequence information. **Computational Biology** is the name given to this process, and it involves the following:

Ligand Binding Domain of Retinoic Acid Receptor

- Finding the genes in the DNA sequences of various organisms
- Developing methods to predict the structure and/or function of newly discovered proteins and structural RNA sequences.
- Clustering protein sequences into families of related sequences and the development of protein models.
- Aligning similar proteins and generating phylogenetic trees to examine evolutionary relationships.

The process of evolution has produced DNA sequences that encode proteins with very specific functions. It is possible to predict the three-dimensional structure of a protein using algorithms that have been derived from our knowledge of physics, chemistry and most importantly, from the analysis of other proteins with similar amino acid sequences. The diagram below summarizes the process by which DNA sequences are used to model protein structure. The processes

Overview

The foundation of Celera's product offering is the Celera Discovery System™, an integrated web-based discovery platform. The unified platform provides online access to the most comprehensive and up-to-date set of genomic and biological data available, along with computational tools and super-computing power. Data integration and management with the Celera Discovery System saves time and reduces costs when trying to set up bench experiments or sifting through enormous amounts to data, thus allowing researchers to accelerate their publication process.

Using Celera's genomic expertise combined with integrated biological information and query and analysis tools, researchers can discover novel genes, predict their function and enhance overall understanding of important biological mechanisms and diseases. Celera's staff of experienced scientists has developed a comprehensive platform to allow researchers to extensively understand how genes and their related proteins function in biological context.

Sequence and Genome Analysis

David W. Mount

[CLICK TO ENLARGE](#)

Overview

The application of computational methods to DNA and protein science is the newest and most exciting development in biology. *Bioinformatics: Sequence and Genome Analysis* by David W. Mount is a comprehensive functional and theoretical introduction to this new discipline. Sequence alignment, structure prediction, phylogenetics and gene prediction, database searching, and genome analysis are amply explained and illustrated in the printed text. Based on the author's extensive teaching experience at the University of Arizona, this is a uniquely educational book, ideal for investigators, graduate students, and biology undergraduates studying this fast-changing discipline.

This Web site provides a link to on-line resources for the book. [Tables explaining numerous Web sites](#) for software and programming are presented here in hyperlinked form. [Additional material](#) not in the printed text is provided, and [problems for classroom use](#) are also given. Further or new material will be added as the Web site develops and the field progresses.

About the Author

David W. Mount is Professor of Molecular and Cellular Biology, Professor of Biochemistry, and Professor of Ecology and Evolutionary Biology at the University of Arizona in Tucson. His broad-ranging research interests include sequence analysis and genomic databases, mechanisms of genetic recombination and radiation resistance in plants, as well as conservation genetics, molecular ecology, and molecular evolution. His book *Bioinformatics: Sequence and Genome Analysis* is based on a course he teaches at the University of Arizona.

About This Web Site

The Bioinformatics Web site augments the content of *Bioinformatics: Sequence and Genome Analysis*. Purchasers of the book can:

- access Web sites mentioned in the text from hyperlinked versions of the relevant tables
- access problem sets for classroom use and other useful material not included in the print edition
- access additional material to complement the print edition
- receive announcements about updates and additions
- receive E-mail alerts about peer-reviewed, new, and updated material that extends the scope and content of the book

Science: 5 June 2002

“Career opportunities in bioinformatics are very, very good ... it seems that every time you turn around a company has decided to set up a bioinformatics group ...”

M. Greene, Gene Logic Inc., Gaithersburg

Companies will ... look for individuals who first and foremost are biologists but have key computational skills.

Those skills are:

- knowledge of UNIX and relational databases, skill with Structured Query Language (SQL) and programming skills (C, Perl, Java)
- Expert knowledge of sequence-analysis programs like BLAST and FASTA
- Web skills, e.g. Hypertext Markup Language (HTML)

“Recruiters get excited over applicants who have applied computational skills in a practical way”

The future of Bioinformatics

- in the future, bioinformatics is likely to become more central to the way biology is done

- as we enter the "post-genomic era", information about gene expression, protein structure and function, data from DNA array technology, as well as epidemiological and disease susceptibility data, are all being integrated with genome sequence information.

- "When graduate students approach me these days about what is an interesting area to go into if you want to make a major contribution to biomedical research, the first thing out of my mouth is bioinformatics ... we are woefully short in terms of having a critical mass of people who understand both biology and computational approaches"

Francis Collins, director of the National Human Genome Research Institute
